ANTOLINI DO BRASIL

# TIPOLOGIA E USO DOS NOSSOS MATERIAIS

## MÁRMORE

O mármore é uma rocha calcária com dureza media, formada por cristais geralmente a malha fina. Esta sua composição permite de obter resultados excepcionais no acabamento altamente lúcido. É indicada principalmente para uso interno.

## GRANITO

Rocha de origem vulcânica com a componente principal de silício que lhe confere uma grande dureza. Os granitos têm uma elevada resistência ao desgaste, ao abrasivo e à compressão. Apresentam-se com as mais variadas tonalidades de cor. Esteticamente apresentam-se homogêneos listrados ou a desenhos orientados. Pela composição são duráveis, seja nos ambientes externos que internos.

## TRAVERTINO

É uma rocha calcária porosa. Os travertinos variam na cor do branco ao bege argenteo, ao amarelo, ao vermelho, ao noz escuro e o tratamento destes é discreto; a superfície pode ser acabada, polida lustrada e mais outros acabamentos. É aconselhado para internos e também para ambientes externos, desde que não sejam excessivamente frios.

## ÔNIX

Pedra calcária a malha finíssima. Estas pedras são consideradas de elevado valor e são utilizadas para revestimentos e elementos ornamentais decorativos, característica intrínseca destas é de ser retro ilumináveis o que as torna pedras altamente preciosas que podem ser usadas nas decorações internas.

## LIMESTONE

Com a palavra pedra entendem-se normalmente materiais cujas característica são diferentes dos outros grupos. Em geral são mais difíceis de polir porque são mais macios. Lembram-se por exemplo, os arenito e as ardósias e, em geral, as rochas sedimentarias. São adaptas principalmente para usos internos, mas algumas pedras nas devidas espessuras, podem ser utilizadas também no exterior.

## QUARTZITO

Muitas pedras de quartzito possuem características físico mecânicas, parecidas a muitos tipo de granito. De boa dureza, muitas vezes podem ser usadas em ambientes externos dependendo do tipo. Utilizáveis porém em ambientes internos se classificam na base da cor do mesmo material.

## SERPENTINITO

Rochas vulcânicas os serpentinos possuem uma resistência à compressão similar aquela do granito. Normalmente têm uma cor verde com tonalidades mais ou menos escuras e podem chegar a apresentar aspectos de vermelho. São geralmente adaptas para uso externo avaliando de vez em vez a tipologia bem como interno.

## PRECIOUSTONE

(Pedra preciosa) Pedras duras usadas ainda hoje na joalheria, podem ser posadas como chapas ou como decoração. Estas pedras são cortadas com espessura de 3 cm ou até de 2 cm. São colocadas de um modo tal de criar surpreendentes quadros naturais que podem ser retro iluminados. Alguns cuidados são aqueles de não colocá-las perto de fontes intensas de calor e portanto, não adaptas a repentinas mudanças de temperatura, aconselhadas portanto a uso somente interno.

## GEMSTONE

(Gemas) São pedras duras de espessura finíssima num suporte de mármore branco que nesta colocação são juntadas criando desenhos homogêneos e preciosos. Alguns cuidados são aqueles de não colocá-las perto das fontes intensas de calor e, portanto, não adaptas a repentinas mudanças de temperatura, aconselhadas portanto a uso somente interno.

## SHELLSTONE

(Madrepérola) É uma gema orgânica formada de estratificações de proteção de carbonato de cálcio que revestem o interior das conchilha das ostras de perola. Trata-se do mesmo processo natural e do mesmo tipo de material das perolas e a sua formação requer um período de quase 10 anos. As maravilhosas cores iridescentes que se vêem nas madrepérola são o resultado da refração da luz sobre várias estratificações de crescimento da conchilha. Estas grande chapas compostas da selecionados exemplares de madrepérola sabiamente juntas para fazer ressaltar a natural beleza da conchilha. Adaptas para o interior.
